1 Implicit Functions

Explicit Function, Implicit Function

Explicit Function

$$x_{n+1} = x_{n+1}(\mathbf{x})$$

In explicit functions, all input $\mathbf{x} = (x_1, \dots, x_n)$ are free (or exogenous) variables. In this form, endogenous variables and exogenous variable (x_{n+1}) can be distinguished easily.

Implicit Function

Let $x_{n+1} = x_{n+1}(\mathbf{x})$. Then, we can find alternative representation

$$G = G(\mathbf{x}, x_{n+1}) = 0$$

G is not a function but an equation (implicit equation). In this representation, x_{n+1} is an implicit function of the exogeneous variables $\mathbf{x} = (x_1, \dots, x_n)$. In this form, we can not distinguish easily between exogenous and endogenous variables.

Implicit Functions: Example

Representing Implicit Function by Explicit Function(s)

$$G(x, y) = x^2 + y^2 - 1 = 0$$

y can be an implicit function of x . On the other hand, x also can be an implicit function of y .

$$y = \begin{cases} \sqrt{1-x^2}, & y \geq 0 \\ -\sqrt{1-x^2}, & y < 0 \end{cases}$$

$$x = \begin{cases} \sqrt{1-y^2}, & x \geq 0 \\ -\sqrt{1-y^2}, & x < 0 \end{cases}$$

We cannot find well-defined functional relationship on the boundary of these explicit functions.

The Implicit Function Theorem (IFT) for \mathbb{R}^2

Main Question

1. Does $G(x, y) = \bar{c}$ determine y as a well-defined continuous function of x for around \bar{x}_0 and \bar{y}_0 ?

2. If (1) is true, $y' = \frac{\partial y}{\partial x} = ?$

We can get IFT on \mathbb{R}^2 by differentiate $G(x, y(x)) = \bar{c}$ wrt x at \bar{x}_0 (Use Chain Rule I: Th14.1)

Chain Rule I

Let $g(t) = f(\mathbf{x}(t))$, $g : \mathbb{R} \rightarrow \mathbb{R}$, $f : \mathbb{R}^n \rightarrow \mathbb{R}$, $\mathbf{x} : \mathbb{R} \rightarrow \mathbb{R}^n$. Then,

$$\frac{dg}{dt} = Df_{\mathbf{x}(\mathbf{x})} \frac{d\mathbf{x}(t)}{dt} = \frac{\partial f}{\partial x_1} \frac{dx_1}{dt} + \cdots + \frac{\partial f}{\partial x_n} \frac{dx_n}{dt}$$

IFT (\mathbb{R}^2)

Theorem 1 (15.1 (IFT)). Let $G(x, y)$ be a C^1 function on $B_\epsilon(\bar{x}_0, \bar{y}_0)$ in \mathbb{R}^2 . Suppose that $G(\bar{x}_0, \bar{y}_0) = \bar{c}$ and consider the implicit equation

$$G(x, y) = \bar{c}$$

If $\frac{\partial G}{\partial y}(\bar{x}_0, \bar{y}_0) \neq 0$, (i.e., tangent line is not vertical) then $\exists y = y(x) \in C^1$ on $I = I_\epsilon(\bar{x}_0)$ s.t.,

$$1. G(x, y(x)) \equiv \bar{c} \quad \forall x \in I$$

$$2. y(\bar{x}_0) = \bar{y}_0$$

3. and

$$y'(\bar{x}_0) = -\frac{\frac{\partial G}{\partial x}(\bar{x}_0, \bar{y}_0)}{\frac{\partial G}{\partial y}(\bar{x}_0, \bar{y}_0)}$$

We can extend IFT on \mathbb{R}^n

IFT on \mathbb{R}^n

Theorem 2 (15.2). Let $G(\mathbf{x}, f)$ be a C^1 function on $B_\epsilon(\bar{\mathbf{x}}_0, \bar{f}_0)$ in \mathbb{R}^n . Suppose that $G(\bar{\mathbf{x}}_0, \bar{f}_0) = \bar{c}$ and consider the implicit equation

$$G(\mathbf{x}, f) = \bar{c}$$

If $\frac{\partial G}{\partial f}(\bar{\mathbf{x}}_0, \bar{f}_0) \neq 0$ (i.e., tangent hyperplane is not vertical), then $\exists f = f(\mathbf{x}) \in C^1$ on $B = B_\epsilon(\bar{\mathbf{x}}_0)$ s.t.,

$$1. G(\mathbf{x}, f(\mathbf{x})) \equiv \bar{c} \quad \forall \mathbf{x} \in B$$

$$2. f(\bar{\mathbf{x}}_0) = \bar{f}_0$$

3. and

$$\frac{\partial f}{\partial x_i}(\bar{\mathbf{x}}_0) = -\frac{\frac{\partial G}{\partial x_i}(\bar{\mathbf{x}}_0, \bar{f}_0)}{\frac{\partial G}{\partial f}(\bar{\mathbf{x}}_0, \bar{f}_0)} \quad \forall i$$

2 Level Curves and Their Tangents

IFT: Geometric Implication

Theorem 3 (15.3). *Let (x_0, y_0) is on the $G(x, y) = \bar{c}$ in the plane and $G \in C^1$.*

Case 1 If $\frac{\partial G}{\partial y}(x_0, y_0) \neq 0$, $\exists y = y(x) \in C^1$ around $x = x_0$ with slope

$$-\frac{\frac{\partial G}{\partial x}(\bar{x}_0, \bar{y}_0)}{\frac{\partial G}{\partial y}(\bar{x}_0, \bar{y}_0)}$$

Case 2 If $\frac{\partial G}{\partial y}(x_0, y_0) = 0$,

Case 2-1 If $\frac{\partial G}{\partial x}(x_0, y_0) \neq 0$, $\exists x = x(y) \in C^1$ around $y = y_0$ with slope

$$-\frac{\frac{\partial G}{\partial y}(\bar{x}_0, \bar{y}_0)}{\frac{\partial G}{\partial x}(\bar{x}_0, \bar{y}_0)}$$

Case 2-2 If $\frac{\partial G}{\partial x}(x_0, y_0) = 0$, there is no well-defined function around (x_0, y_0) (irregular point)

Regular on \mathbb{R}^2

Definition 1 (Regular Point). *(x_0, y_0) is a regular point of the $G(x, y) \in C^1$ if:*

$$DG_{(x,y)}(x_0, y_0) = \left(\frac{\partial G}{\partial x}(x_0, y_0), \frac{\partial G}{\partial y}(x_0, y_0) \right) \neq \mathbf{0} = (0, 0)$$

We can find well-defined explicit function form around regular point. Geometrically, this implies smooth curve (or 1d manifold, 1d object) in \mathbb{R}^2

Theorem 4 (15.4). *Let $G \in C^1$ around (x_0, y_0) and this point is regular. Then, $\nabla G(x_0, y_0)$ is perpendicular to the level set of G at (x_0, y_0)*

$$\nabla G(x_0, y_0) \bullet \left(1, -\frac{\frac{\partial G}{\partial x}(\bar{x}_0, \bar{y}_0)}{\frac{\partial G}{\partial y}(\bar{x}_0, \bar{y}_0)} \right) = 0$$

Extention to \mathbb{R}^n Space

Definition 2 (Regular Point on \mathbb{R}^n). *\mathbf{x}_0 is a regular point of the $G(\mathbf{x}) \in C^1$ if:*

$$\nabla G(\mathbf{x}_0) = DG_{\mathbf{x}}(\mathbf{x}_0) \neq \mathbf{0}$$

We can find well-defined explicit function form around regular point. Geometrically, this implies smooth hypersurface (or $n - 1$ dimensional manifold, $n - 1$ dimensional object) in \mathbb{R}^n

Theorem 5 (15.6). *If $f : \mathbb{R}^n \rightarrow \mathbb{R} \in C^1$, $\mathbf{x}^* \in \mathbb{R}^n$, and $\nabla f(\mathbf{x}^*) \neq \mathbf{0}$, Then:*

1. *The level set of f through \mathbf{x}^* ,*

$$\mathcal{F}_{f(\mathbf{x}^*)} \equiv \{\mathbf{x} : f(\mathbf{x}) = f(\mathbf{x}^*)\}$$

*can be viewed as the graph of real-valued C^1 function of $(n - 1)$ variables in a neighborhood of \mathbf{x}^**

2. *$\nabla f(\mathbf{x}^*)$ is perpendicular to the tangent hyperplane of $\mathcal{F}_{f(\mathbf{x}^*)}$ at \mathbf{x}^**

3. *\mathbf{v} is a tangent vector of $\mathcal{F}_{f(\mathbf{x}^*)}$ at \mathbf{x}^* iff $Df_{\mathbf{x}}(\mathbf{x}^*) \bullet \mathbf{v} = 0$*

3 Systems of Implicit Functions

Systems of Implicit Functions

Definition 3 (System of implicit functions). A set of m equations in $m + n$ unknowns

$$\mathbf{f}(x_1, \dots, x_{m+n}) = \mathbf{c} \in \mathbb{R}^m$$

is called a system of implicit functions if there is a partition of the variables into n exogenous variables and m endogenous variables, so that if exogenous variables are given, the resulting system can be solved uniquely.

By linearization, we can solve df_1, \dots, df_m from given dx_1, \dots, dx_n around $(\mathbf{f}, \mathbf{x}) = (\mathbf{f}^*, \mathbf{x}^*)$

Linearization

Linearized System

We can get linearize system from nonlinear system

$$\begin{aligned} F_1(f_1, \dots, f_m, x_1, \dots, x_n) &= \bar{c}_1 \\ F_2(f_1, \dots, f_m, x_1, \dots, x_n) &= \bar{c}_2 \\ &\dots \\ F_m(f_1, \dots, f_m, x_1, \dots, x_n) &= \bar{c}_m \end{aligned}$$

by taking derivative on a given point $(\mathbf{f}, \mathbf{x}) = (\mathbf{f}^*, \mathbf{x}^*)$,

$$\begin{aligned} \frac{\partial F_1}{\partial f_1} df_1 + \dots + \frac{\partial F_1}{\partial f_m} df_m + \frac{\partial F_1}{\partial x_1} dx_1 + \dots + \frac{\partial F_1}{\partial x_n} dx_n &= 0 \\ \vdots &\vdots \\ \frac{\partial F_m}{\partial f_1} df_1 + \dots + \frac{\partial F_m}{\partial f_m} df_m + \frac{\partial F_m}{\partial x_1} dx_1 + \dots + \frac{\partial F_m}{\partial x_n} dx_n &= 0 \end{aligned}$$

Solving Linearized System

Solving Prodecure

$$\begin{aligned} \frac{\partial F_1}{\partial f_1} df_1 + \dots + \frac{\partial F_1}{\partial f_m} df_m &= - \left(\frac{\partial F_1}{\partial x_1} dx_1 + \dots + \frac{\partial F_1}{\partial x_n} dx_n \right) \\ \vdots &\vdots \\ \frac{\partial F_m}{\partial f_1} df_1 + \dots + \frac{\partial F_m}{\partial f_m} df_m &= - \left(\frac{\partial F_m}{\partial x_1} dx_1 + \dots + \frac{\partial F_m}{\partial x_n} dx_n \right) \end{aligned}$$

In this system, $d\mathbf{f}$ is unknown and others are given explicitly. Therefore,

$$d\mathbf{f} = -(D\mathbf{F}_{\mathbf{f}}(\mathbf{f}^*, \mathbf{x}^*))^{-1} \cdot D\mathbf{F}_{\mathbf{x}}(\mathbf{f}^*, \mathbf{x}^*)$$

and when $d\mathbf{x} = d\mathbf{x}^*$, $\mathbf{f} = \mathbf{f}^* + d\mathbf{f}$
